Proficiency Test Report

FLX-CRM 105, FLX-CRM 106, FLX-CRM 107, FLX-CRM 108, FLX-CRM 109, FLX-CRM 110

Introduction

X-ray fluorescence analysis is a widely used technique for the analysis of oxidic materials. Different ISO methods like e.g. 12677:2011 or 29581-2:2010 describe the use in detail.

However for the calibration of xrf instruments dedicated standard material is needed. As a world wide supplier for xrf laboratories FLUXANA has developed a number of services to support xrf users. One of these services is the production of new reference materials in combination with a proficiency test.

From 2011 FLUXANA has introduced its own quality management in agreement with ISO 17025.

The production of reference materials and the corresponding proficiency tests including all evaluations are performed in agreement with ISO 17043, ISO Guide 34-2009, ISO Guide 31-2000 and ISO Guide 35-2006.

Proficiency test

All laboratories which applied until 30.06.2011 for the participation of the proficiency test got their samples in August 2011 and sent in their results until end of 2011.

Further information

In the following evaluation report all laboratory data are listed. Also the used method XRF, ICP-OES, wet chemistry, ion chromatography (IC), combustion or others is specified. Laboratories which are working under ISO 17025 accreditation are highlighted. Under Remark additional information is given.

Certificate of Analysis

Based on this report a certificate of analysis is issued separately.

Outlier evaluation

There will be two outlier tests based on **Grubbs** and **z-score**.

However every outlier detected by the test was verified individually. Sometimes a value detected as outlier is included to guarantee a balance between different analytical methods. These values are marked as **'included'**. Real outliers which were excluded from the calculation of mean, standard deviation and uncertainty are marked as **'confirmed outliers'**.

Statistical Evaluation for a new RM (reference material)

All mentioned calculations are based on:

Reference materials – General and statistical principles for certification ISO Guide 35:2006.

Conformity assessment - General requirements for proficiency testing ISO 17043:2010.

Calculation of laboratory average

Each participant of the proficiency test must perform a number of single measurements and report with significant digits.

For each participant a laboratory average \bar{x} is calculated:

$$(1) \quad \bar{x} = \sum_{k=1}^p \frac{x}{p}$$

1 x Single measurement

p Number of single measurements

Calculation of total average

From all laboratory averages a total average $\bar{\bar{x}}$ is calculated:

$$(2) \quad \bar{\bar{x}} = \sum_{k=1}^n \frac{\bar{x}}{n}$$

n Number of participants

Calculation of standard deviation

From all laboratory averages the standard deviation s is calculated:

$$(3) \quad s = \sqrt{\sum_{k=1}^n (\bar{x} - \bar{\bar{x}})^2 / (n - 1)}$$

Test for outliers

From all laboratory averages the **z-score** z is calculated:

$$(4) \quad z = \left| \frac{(\bar{x} - \bar{x})}{s} \right|$$

An outlier test based on z-score is performed:

| | |
|-----------------|---|
| $z \leq 2,0$ | indicates ‚satisfactory‘ performance = generates no signal |
| $2,0 < z < 3,0$ | indicates ‚questionable‘ performance = generates a warning signal |
| $z \geq 3,0$ | indicates ‚unsatisfactory‘ performance = generates an action signal |

Parallel an outlier test based on Grubbs is performed:

$$(5) \quad PG = \left| \frac{(\bar{x} - \bar{x})}{s} \right|$$

PG test value

Based on table 1 a comparison value for the half width confidence interval is calculated for n:

| | |
|--------------|---|
| $PG \leq VG$ | indicates ‚satisfactory‘ performance = generates no signal |
| $PG > VG$ | indicates ‚unsatisfactory‘ performance = generates an action signal |

In case an outlier is detected the data will be taken out and all calculations according formulars 2,3,4,5 have to be repeated. A new test for outliers must be performed.

Calculation of the uncertainty

The uncertainty values are coming from the half width confidence interval C(95%). It is equal to:

$$(6) \quad C(95\%) = t * s / \sqrt{n}$$

t Student's value

where t is the appropriate Student's value, n the number of acceptable mean values and s the standard deviation.
