Abstract

Results are presented for GeoPT36A, the subject of round thirty-six of the International Association of Geoanalysts' Proficiency Testing programme for analytical geochemistry laboratories. The test sample distributed in this round was a metal-rich sediment, SdAR-M2, supplied by Dr Stephen Wilson of the U.S. Geological Survey. In this report, the data contributed from 84 laboratories are listed, together with an assessment of consensus values, consequent z-scores and charts to show the distribution of contributed results and the overall performance of participating laboratories.

Introduction

This thirty-sixth round of the international proficiency testing programme, GeoPT, was conducted in a similar manner to earlier rounds. The programme is designed to be part of the routine quality assurance procedures employed by analytical geochemistry laboratories. The programme is organised by the International Association of Geoanalysts and is conducted in accordance with a published protocol available at (<http://www.geoanalyst.org/documents/GeoPT-protocol.pdf>). The overall aim of the programme is to provide participating laboratories with z-score information for reported elemental determinations from which the laboratory can decide whether the quality of their data is satisfactory in relation both to their chosen fitness-for-purpose criteria and to the results submitted

by other laboratories contributing to the round and can choose to take corrective action if this appears justified.

Steering Committee for Round 36A: P.C. Webb (results coordinator), M. Thompson (statistical advisor), P.J. Potts (analytical advisor), S. Wilson (provision of SDAR-M2).

Timetable for Round 36A:

Distribution of sample: September 2014.

Deadline for submission of analytical results:
12th December 2014.

Release of report: February 2015

Test Material details

GeoPT36A: The metal-rich sediment test material, SdAR-M2, was produced at the U.S. Geological Survey under the direction of Stephen Wilson. It was produced by blending and designed to resemble sediment sampled when monitoring moderate levels of environmental contamination associated with discharges from a mining operation. The test material was evaluated for homogeneity by the originator and as a result, the sample was considered suitable for use in this proficiency test.

Submission of results

3189 results were submitted for GeoPT36A (SdAR-M2) by 84 laboratories as listed in Table 1. Submission of data was by the recently introduced online system

developed by KPMD (IT Solutions) Ltd, Sheffield, England. In Table 1 results designated as data quality 1 are shown in bold: results of data quality 2 are shown underlined. Results from all laboratories submitting data were used to assess respective assigned values.

However, in our **Instructions to Analysts** participants are instructed that values of '0', i.e. zero, should not be reported, but this was done by a number of laboratories. Zero is not regarded as a valid result, and 12 such values were excluded from consideration.

Assigned values

Following procedures described in earlier rounds, a robust statistical procedure was used to derive assigned concentration values [X_a], these being judged to be the best available estimates of the true composition of this sample. Values were assigned on the basis that: (i) sufficient laboratories had contributed data for an element, and (ii) the statistical assessment gave confidence that the results distribution showed a central portion approximating to a normal distribution. Part of this assessment involved examining a bar chart of contributed data for each element to judge the distribution of results.

Table 2 lists assigned and provisional values for 11 major components and 47 trace elements in GeoPT36A (SDAR-M2). Bar charts for the 58 elements/components of GeoPT36A that were judged to have satisfactory distributions for consensus values to be given assigned or provisional values are shown in Figure 1. These are: SiO₂, TiO₂, Al₂O₃, Fe₂O₃T, MnO, MgO*, CaO, Na₂O, K₂O, P₂O₅*, LOI*, As*, Ba, Be, Bi, Cd, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Ga, Gd, Ge*, Hf, Hg, Ho, In*, La, Li, Lu, Mo, Nb, Nd, Ni, Pb, Pr, Rb, Sb*, Sc, Sm, Sn*, Sr, Ta, Tb, Th, Tl*, Tm, U, V, W*, Y, Yb, Zn and Zr. Of these, only provisional values were given to the 10 marked '*'. Instances of provisional status were recorded because either i) a relatively small number of measurements contributed to the consensus, or ii) the results were significantly dispersed in relation to the target value or the distribution was in part non-symmetrical.

In 20 cases the robust mean was used to define the consensus value, but in 38 cases the median value was preferred.

Bar charts for the 10 elements/components: Fe(II)O, CO₂, Ag, B, C(tot), Cl, F, S, Se and Te are plotted in Figure 2 for information only, as the data were insufficient or too variable for the reliable determination of a consensus.

Z-score analysis

As in previous rounds, laboratories were invited to choose one of two performance standards against which their analytical results would be judged:

Data quality 1 for laboratories working to a 'pure geochemistry' standard of performance, where analytical results are designed for geochemical research and where care is taken to provide data of high precision and accuracy, sometimes at the expense of a reduced sample throughput rate. For GeoPT36A, 1608 results of data quality 1 were submitted.

Data quality 2 for laboratories working to an 'applied geochemistry' standard of performance, where, although precision and accuracy are still important, the main objective is to provide results on large numbers of samples collected, for example, as part of geochemical mapping projects or geochemical exploration programmes. For GeoPT36A, 1581 results of data quality 2 were submitted.

The target standard deviation (H_a) for each element assessed was calculated from a modified form of the Horwitz function as follows:

$$H_a = k.X_a^{0.8495}$$

Where X_a is the concentration of the element expressed as a *fraction*; the factor $k = 0.01$ for pure geochemistry labs and $k = 0.02$ for applied geochemistry labs.

Z-scores were calculated for each elemental result submitted by each laboratory from:

$$z = [X - X_a] / H_a$$

where: X is the contributed result, X_a is the assigned value and H_a is the target standard deviation.

Z-score results for contributors to GeoPT36A are listed in Table 3. Participating laboratories are invited to assess their performance using the following criterion:– Z-score results in the range $-2 < z < 2$ are considered to be 'satisfactory' (in the sense that no action is called for by the participant). If the z-score for any element falls outside this range, especially if it is outside the range $-3 < z < 3$, it would be advisable for the contributing laboratory to examine its procedures, and if necessary, take action to ensure that determinations are not subject to unsuspected analytical bias.

Overall performance

A summary of the overall performance of individual laboratories in this round is plotted in multiple z-score charts for GeoPT36A in Figure 3. In these charts, the z-score performance for each element is distinguished by symbols that make it simple to identify whether the results were satisfactory or gave z-scores that exceeded the action limits. This chart is designed to help individual laboratories to judge their overall performance in this proficiency testing round.

Participants should always review their z-scores in accord with their own fitness-for-purpose criteria.

Participation in future rounds

The benefit from proficiency testing arises from regular participation and laboratories are invited to contribute to the GeoPT37 round, the test sample for which will be distributed during March 2014.

Reminder to participants

Participants are instructed (in our **Instructions to Analysts**) that '0', i.e. zero, should not be reported as a result. For GeoPT36A, 12 zeros were reported and were disregarded. It is recommended that participants do not report zeros in future.

Acknowledgements

The authors thank Liz Lomas for much-valued assistance in distributing this sample. Thanks also to Mick Daniels and Ben Solway of KPMD (IT Solutions) Ltd for developing an efficient system for producing this report.

GeoPT36A - Barchart for Nd

GeoPT36A - Barchart for Ni

GeoPT36A - Barchart for Pb

GeoPT36A - Barchart for Pr

GeoPT36A - Barchart for Rb

GeoPT36A - Barchart for Sb

Figure 1: GeoPT36A - Metal-rich sediment, SdAR-M2. Data distribution charts for elements for which values were assigned or provisional values given for guidance. Horizontal lines show the limits for $-2 < z < 2$ for pure geochemistry labs (solid lines) and $-2 < z < 2$ for applied geochemistry labs (pecked lines).

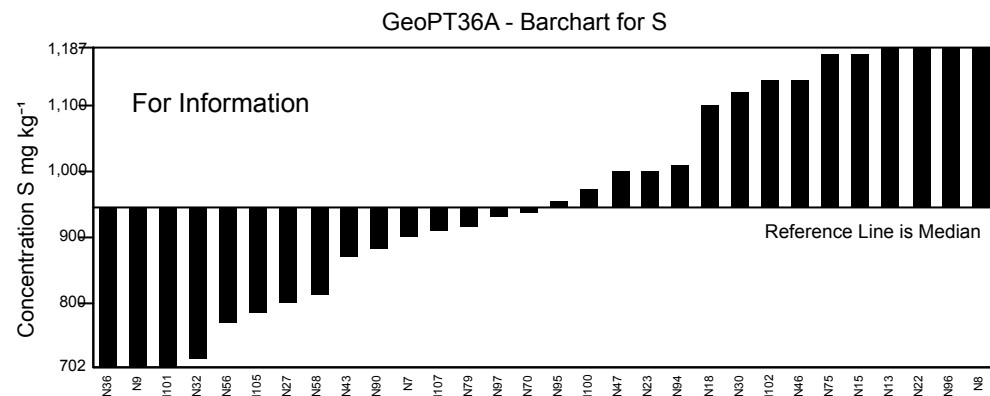

Figure 2: GeoPT36A - Metal-rich sediment, SdAR-M2. Data distribution charts provided for information only for elements for which values could not be assigned.

Multiple Z-Score Chart for GeoPT36A

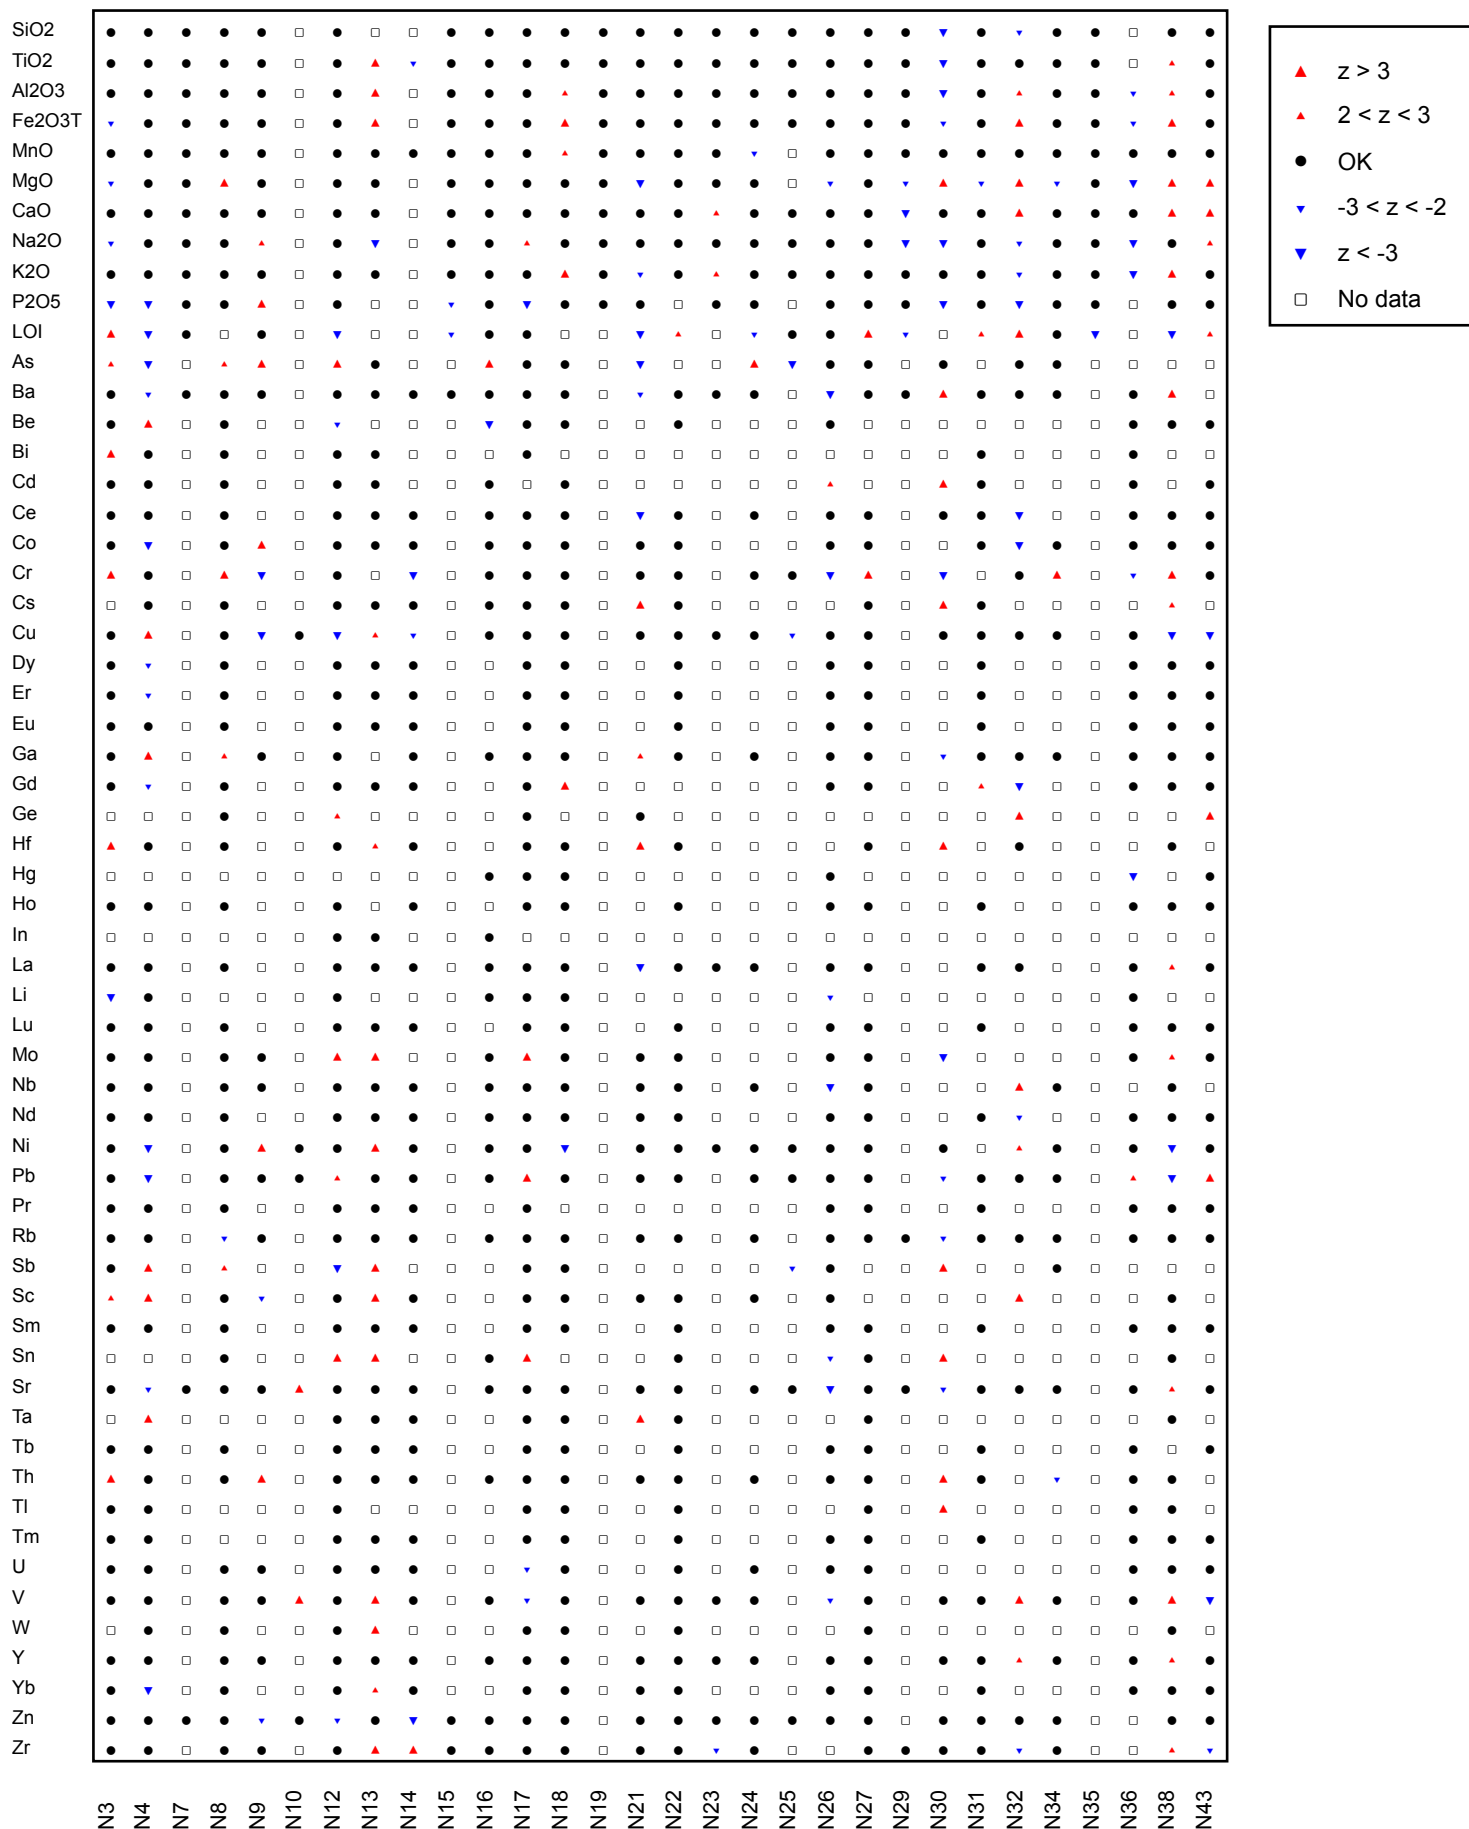

Figure 3: GeoPT36A - Metal-rich sediment, SdAR-M2. Multiple z-score charts for laboratories participating in the GeoPT36 A round. Symbols indicate whether or not an elemental result complies with the $-2 < z < +2$ criteria (see key).

Multiple Z-Score Chart for GeoPT36A

Figure 3: GeoPT36A - Metal-rich sediment, SdAR-M2. Multiple z-score charts for laboratories participating in the GeoPT36 A round. Symbols indicate whether or not an elemental result complies with the $-2 < z < +2$ criteria (see key).

Multiple Z-Score Chart for GeoPT36A

Figure 3: GeoPT36A - Metal-rich sediment, SdAR-M2. Multiple z-score charts for laboratories participating in the GeoPT36 A round. Symbols indicate whether or not an elemental result complies with the -2<z<+2 criteria (see key).
