Abstract

Results are presented for Round 40 of the International Association of Geoanalysts' Proficiency Testing programme for analytical geochemistry laboratories. The test material distributed in this routine round of GeoPT was a silty marine shale, ShWYO-1, supplied by Dr Stephen Wilson of the U.S. Geological Survey. In this report, the data contributed by 102 laboratories are listed, together with an assessment of consensus values, consequent *z*-scores and charts to show the distribution of contributed results and the overall performance of participating laboratories.

Introduction

This fortieth round of the international proficiency testing programme, GeoPT, was conducted in a similar manner to earlier rounds. The programme is designed to be part of the routine quality assurance procedures employed by analytical geochemistry laboratories. The programme is organised by the International Association of Geoanalysts and is conducted in accordance with a published protocol available at (<http://www.geoanalyst.org/documents/GeoPT-protocol.pdf>). The overall aim of the programme is to provide participating laboratories with *z*-score information for reported elemental determinations from which the laboratory can decide whether the quality of their data is satisfactory in relation both to their chosen fitness-for-purpose criteria and to the results submitted

by other laboratories contributing to the round. In circumstances where *z*-scores are unsatisfactory, a participating laboratory is encouraged to investigate for unsuspected analytical bias and to take corrective action if this appears justified.

Steering Committee for Round 40:

P.C. Webb (results coordinator), M. Thompson (statistical advisor), P.J. Potts and C.J.B. Gowing (analytical advisors), S.A. Wilson (provision of ShWYO-1).

Timetable for Round 40:

Distribution of sample: September 2016

Results submission deadline: 14th December 2016

Release of report: February 2017

Test Material details

GeoPT40: The silty marine shale test material, ShWYO-1, was supplied by Dr Stephen Wilson. The test material was evaluated for homogeneity by the originator, and as a result, the sample was considered suitable for use in this proficiency test.

Submission of results

3597 results were submitted for GeoPT40 (ShWYO-1) by 102 laboratories as listed in Table 1, where results designated as data quality 1 (see **Z-score analysis** section below) are shown in bold and results of data

quality 2 are shown underlined. Results from all laboratories submitting data were used to assess respective assigned values. Regrettably there were three laboratories reporting in total 5 values of '0' (i.e. zero), for this round. We should emphasise that, as stated in the *Instructions to Analysts*, such values should not be reported. These 5 values were excluded from consideration in the data assessment process.

Assigned values

Following procedures described in earlier rounds, robust statistical procedures were used to derive assigned mass fraction values [X_a] for measurands in this test sample, these values being judged to be the best available estimates of the true composition. Values were assigned on the basis that: i) sufficient laboratories had contributed data for a measurand, and ii) visual assessment gave confidence that a substantial proportion of the results distribution was symmetrically disposed. Part of this assessment involved examining bar charts of contributed data for each measurand to judge the distribution of results (presented in Figures 1 and 2). For this round it has also been possible to view data distributions according to analytical procedure and assess the comparative quality of data obtained using different procedures.

Many datasets were normally disposed and showed remarkable symmetry with relatively little dispersion of data. Consequently, in 16 cases the robust mean was used to define an appropriate consensus value. However, many other datasets were slightly skewed and some, more severely skewed. In the majority of such cases medians provided a satisfactory estimator for defining consensus values: 29 cases in all. Where the median did not provide a symmetrical distribution of data about the consensus, the mode was preferred, and was used in 10 cases for defining a consensus.

Our interpretation as to why selected data distributions were skewed is as follows: Firstly, skewed data distributions for SiO_2 and Na_2O were due largely to the use of powder pellets for analysis by XRF by a number of laboratories. Matrix corrections are difficult to assess

for low atomic number major elements and frequently underestimated when analysing powder pellets by XRF. Secondly there were notable low tails to data distributions for Zr and Hf, which is thought to be due to incomplete dissolution of zircons in many cases when acid digestion was the method of sample preparation by both ICP-MS and ICP-OES/AES techniques. Thirdly, there were also high tailed data distributions for As, Co, Cs, La, Mo, Sb, and W, due in large part to extremely variable XRF data reported for mass fractions that are close to the expected detection limit for this technique. Although many of these datasets were highly skewed, it was possible to determine modes when a substantial body of data formed a clear consensus. In eight cases modes were sufficiently well defined by techniques appropriate for the mass fraction present to justify designation of assigned values. In the other two cases provisional status was allocated (see Table 2). The procedure used to determine the mode involved the estimation of the mass fraction corresponding to the maximum value of the kernel density distribution for the dataset. This provided a consensus value that represented the most coherent part of the data distribution where data were symmetrically disposed.

Table 2 lists assigned and provisional values for 10 major components and 45 trace elements in GeoPT40 (ShWYO-1). Bar charts for the 55 measurands of GeoPT40 that were judged to have satisfactory distributions to permit consensus values to be designated with assigned or provisional status are shown in Figure 1. These are: SiO_2 , TiO_2 , Al_2O_3 , $\text{Fe}_2\text{O}_3\text{T}$, MnO , MgO , CaO , Na_2O , K_2O , P_2O_5 , As, Ba, Be, Bi*, C(tot)*, Ce, Co, Cr, Cs, Cu, Dy, Er, Eu, Ga, Gd, Ge*, Hf, Ho, La, Li, Lu, Mo, Nb, Nd, Ni, Pb, Pr, Rb, Sb, Sc, Sm, Sn, Sr, Ta, Tb, Th, Tl, Tm, U, V, W*, Y, Yb, Zn and Zr. Of these, provisional values were given to the 4 elements marked '*'. Instances of provisional status were recorded because either i) a relatively small number of results contributed to the consensus, or ii) the results were unduly dispersed in relation to the target value, or iii) the distribution of values was severely skewed.

Bar charts for the 15 measurands: Fe(II)O, H₂O⁺, CO₂, LOI, Ag, B, C(org), Cd, Cl, F, Hg, In, S, Se and Te are plotted in Figure 2 for information only, as the data were insufficient in number, the distribution too highly skewed or too variable for the reliable determination of a consensus for the estimation of *z*-scores. It is of particular note that reported values for Hg and In were particularly consistent, with median values of 0.046 and 0.043 mg kg⁻¹ respectively, but insufficient values were submitted to justify reporting *z*-scores.

Z-score analysis

As in previous rounds, laboratories were invited to choose one of two performance standards against which their analytical results would be judged:

Data quality 1 for laboratories working to a 'pure geochemistry' standard of performance, where analytical results are designed for geochemical research and where care is taken to provide data of high precision and accuracy, sometimes at the expense of a reduced sample throughput rate. For GeoPT40, 1595 results of data quality 1 were submitted.

Data quality 2 for laboratories working to an 'applied geochemistry' standard of performance, where, although precision and accuracy are still important, the main objective is to provide results on large numbers of samples collected, for example, as part of geochemical mapping projects or geochemical exploration programmes. For GeoPT40, 2002 results of data quality 2 were submitted.

The target standard deviation (H_a) for each measurand assessed was calculated from a modified form of the Horwitz function as follows:

$$H_a = k.X_a^{0.8495}$$

Where X_a is the mass fraction of the element; the factor $k = 0.01$ for pure geochemistry laboratories and $k = 0.02$ for applied geochemistry laboratories.

Z-scores were calculated for each elemental measurement submitted by each laboratory from:

$$z = [X - X_a] / H_a$$

Where X is the contributed measurement, X_a is the assigned value and H_a is the target standard deviation (all as mass fractions). *Z*-score values for results contributed to GeoPT40 are listed in Table 3. Results designated as data quality 1 are shown in bold: results of data quality 2 are shown underlined. *Z*-scores derived from provisional values are shown in italics.

Participating laboratories are invited to assess their performance using the following criteria:-

Z-score results in the range $-2 < z < 2$ are considered to be 'satisfactory' (in the sense that no action is called for by the participant). If the *z*-score for any element falls outside this range, especially if it is outside the range $-3 < z < 3$, contributing laboratories are advised to examine their procedures, and if necessary, take action to ensure that determinations are not subject to unsuspected analytical bias.

Overall performance

A summary of the overall performance of individual laboratories for this round is plotted in multiple *z*-score charts in Figure 3. In these charts, the *z*-score performance for each element is distinguished by symbols that make it simple to identify whether the results were satisfactory or gave *z*-scores that exceeded the action limits. This chart is designed to help individual laboratories to judge their overall performance in this proficiency testing round. Participants should always review their *z*-scores in accord with their own fitness-for-purpose criteria.

Participation in future rounds

The benefit from proficiency testing arises from regular participation and laboratories are invited to contribute to Round 41, the test sample for which will be distributed during March 2017.

Acknowledgements

The authors thank Cynthia Turner for much-valued assistance in distributing this sample and Thomas Meisel for development of software which has greatly assisted the investigation of data according to analytical procedure.
