Proficiency Test Report

Glass and Sand Samples

Yenişehir-Bursa, 14.01.2018

Statistics-Report-Coordinator of PT
Mehmet Ali AK
Lead Researcher

Table of Contents

1. INTRODUCTION

Chemical analysis of glasses and sands are used for process control in glass manufacture, for demonstration specification compliance and for relating chemical properties to performance attributes. X-ray fluorescence analysis is a widely used technique for the analysis of oxidic materials. This report is an Interlaboratory study on chemical analyses of glass and sand samples by X-ray fluorescence analysis. In this interlaboratory study 10 laboratories did register for participation. 9 laboratories provided results for glass samples covering 9 analytes, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O, SO_3. And 10 laboratories provided results for sand samples covering 8 analytes, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O. All evaluations are performed in agreement with ISO 13528:2015 Statistical methods for use in proficiency testing by interlaboratory comparison.

Interlaboratories Comparison Test Provider

Turkiye Sise ve Cam Fabrikalari AS - Yenisehir Regional Laboratory

Trakya Yenisehir Cam Sanayi, YOSAB Tabakhane Mah, Sisecam Cad, No:2

Yenisehir-Bursa/TURKEY

Coordinator and Responsible for evaluation and data processing: Mehmet Ali AK

2. PARTICIPANTS

2.1. Participant Accreditation

It is important to know whether or not the participant laboratory works under "ISO/IEC 17025:2017 General requirements for the competence of testing and calibration laboratories" accreditation. Therefore, we asked this information to all laboratories who were participated. In this study, all laboratories work under ISO/IEC 17025 accreditation.

2.2. Number of Participants

In this interlaboratory study 10 laboratories did register for participation. 9 laboratories provided results for glass samples covering 9 analytes, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O, SO_3. And 10 laboratories provided results for sand samples covering 8 analytes, SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O.

Analysis results are valid for only the analyzed sample. This report may not be reproduced other than in full except with the permission of laboratory. Unsigned *or* unsealed reports are invalid
This report has two prints; original and a copy of original.

3. SAMPLES

3.1. Sample Selection

Interlaboratories Comparison Test Items

Test item	Description
Glass Sample 1	1-Float Glass (high Fe_2O_3)
Glass Sample 2	2-Tableware Glass (low Fe_2O_3)
Sand Sample 1	1-Sand Sample (high Fe_2O_3)
Sand Sample 2	2-Sand Sample (low Fe_2O_3)

3.2. Sample Preparation

30 pieces of flat glass were provided by Yenisehir Regional Laboratory. 30 pieces of tableware products, 20 kilograms of high Fe_2O_3 sand and 20 kilograms of low Fe_2O_3 sand were provided by Eskisehir Regional Laboratory. Sand samples were dried at 110°C for 3 hours. The drying process must result in a constant weight. After cooling, the samples were subjected to reduction by quartering. Each sand sample was divided to three (3) bags. Each sample in bags was grinded in a grinder machine.

3.3. Sample Homogeneity and Stability Testing

The measurements for the homogeneity and stability studies were performed by Yenisehir Regional Laboratory. Homogeneity and stability were evaluated according to "ISO 13528:2015 Statistical methods for use in proficiency testing by interlaboratory comparison" . For each glass sample, 5 (five) glass pieces were randomly selected and measured. For each sand sample, samples were divided to 3 (three) bags. And from each bag 5 (five) samples were randomly selected and measured. The data showed that the samples were homogenous.

3.4. Sample Distribution

The samples were dispatched on 11th October 2017. Each participant received two (2) labeled glass samples and two (2) labeled brown bottles including sand samples. The closing date for submitting results was the 20th November 2017, which was further extended to 15th December 2017 for some laboratories that encountered problems with sample delivery and results.

4. EXPERIMENTAL METHOD:

Recommendation for sand samples

Sand samples are moisture sensitive. It has to be dried for minimum 1 hour at 110°C prior use. The drying process must result in a constant weight. 1 g of the dried sample is mixed with 4 g of flux in a platinum/gold (%95:5) crucible and melted in an automatic fusion machine or melted manually in a muffle furnace.

Analysis results are valid for only the analyzed sample. This report may not be reproduced other than in full except with the permission of laboratory. Unsigned *or* unsealed reports are invalid
This report has two prints; original and a copy of original.

5/60

| Form No: KG.FO.20-8 | Yayın Tarihi: 08.01.2007 | Revizyon No: 03 | Revizyon Tarihi: 06.06.2017 |

Recommendation for glass samples

Glass samples are stable materials. For sample preparation grinding and polishing are adviced for more intensity in XRF machine, also for more stable and accurate results.

However, since each laboratory has its own sample preparation method, there is no requirement in this regard.

5. STATISTICAL EVALUATION OF PT:

Calculation of Mean m

The mean m for all laboratories is calculated using the Hampel estimator (ISO/TS 20612:2007 9.2.3) based on the laboratory means μ.

Calculation of reproducibility standard deviation s_R

The reproducibility standard deviation s_R is calculated using the Q-method (ISO/TS 20612:2007 9.2.3).

Calculation of repeatability standard deviation s_r

The repeatability standard deviation s_r is also calculated using the Q-method.

Uncertainty of Mean U

The uncertainty of mean U for k=2 (95% confidence level) is calculated from the reproducibility standard deviation s_R and the laboratories p with valid data according ISO 13528:2015:

$$U = 2 * 1.25 * \frac{s_R}{\sqrt{p}}$$

(1)

Laboratory performance

Laboratory proficiency assessment is based on z-scores.

From all laboratory means µ, the z-score z is calculated:

$$Z = \frac{m-\mu}{s_R}$$

(2)

m	Mean value of all laboratories (assigned value)
µ	Mean value of individual laboratory
sR	Reproducibility standard deviation

Assessment of z-scores

$|z| \leq 2.0$	indicates, satisfactory' performance = generates no signal
$2.0 < |z| < 3.0$	indicates, questionable' performance = generates a warning signal
$|z| \geq 3.0$	indicates, unsatisfactory' performance = generates an action signal

All laboratory means µ with $3 \geq |z| \geq 2$ were highlighted with a yellow color, z-scores with $|z| \geq 3$ were highlighted with a red color.

Note: Non numerical results (e.g. < % x) were not evaluated.

6. RESULTS

For all samples and measurands, 312 data was collected in total. The data was calculated according to "ISO 13528:2015 Statistical methods for use in proficiency testing by interlaboratory comparisons". 36 data was calculated as outliers. It was seen that 89% of the data was successful.

6.1. Summary Results of Glass Sample - 1

Table 1: Glass Sample – 1 Measurand SiO_2

Sample: Glass 1   Assigned value: 71.469 % (Empirical value)
Measurand: SiO2   Rel. SDPA: 0.53% (Empirical value)
Statistical method: Q/Hampel   Rel. repeatability s.d.: not available
Number of laboratories in calculation: 9   Range of tolerance: 70.714 - 72.223 % (|Z Score| <= 2.000)
## Table 2: Glass Sample – 1 Measurand Al_2O_3

Sample: Glass 1   Assigned value: 1.147 % (Empirical value)
Measurand: Al2O3   Rel. SDPA: 3.83% (Empirical value)
Statistical method: Q/Hampel   Rel. repeatability s.d.: not available
Number of laboratories in calculation: 9   Range of tolerance: 1.059 - 1.235 % (|Z Score| <= 2.000)
Analysis results are valid for only the analyzed sample. This report may not be reproduced other than in full except with the permission of laboratory. Unsigned *or* unsealed reports are invalid
This report has two prints; original and a copy of original.
